

BLUHEALTH

AI Integrated Care | Anytime | Anywhere

The BluHealth Platform is a forward-thinking initiative designed to transform healthcare. We envision a connected system that enhances accessibility, streamlines processes, and ultimately improves outcomes for both patients and public health.

BLUE CLOUD SOFTECH
serving technology better

BLU HEALTH
UR HEALTH COMPANION

Vision

From remote communities to urban hubs, BluHealth aims to become the most trusted, AI screening ecosystem — empowering prevention, early detection, and data-driven health management at scale.

What is BluHealth?

Early diagnosis

Using AI-powered tools to detect health conditions before they become serious

Remote monitoring

Tracking patient health from a distance using connected devices

Community health management

Coordinating healthcare delivery across populations

BluHealth is a next-generation, AI-powered healthcare platform built to transform healthcare delivery. It integrates AI, multi-sensor hardware, and cloud-connected infrastructure to bring clinical-grade diagnostics to the last mile—while ensuring full compliance with **HIPAA** and **GDPR** regulations.

Platform Overview

BluHealth Core Platform

- Conversational AI Bot – Empathetic, guided health dialogues
- Agentic AI – Automates screening flows, triage, and workflows
- HIMS – Manages patient records, referrals, operations

BluHealth Screener (Mobile App)

- AI/ML-powered health screening
- Designed for frontline health workers, field use and personal health monitoring

BluHealth Scanner (Device)

- Rugged, portable, solar-compatible hardware
- Embedded with sensors for: ECG, PPG, EMG, GSR, Temperature

BluHealth Screener: How It Works

Smartphone Camera
Uses smartphone camera + rPPG
technology (remote
photoplethysmography)

Vital Measurements
Blood Pressure, Heart Rate,
Respiration Rate, Spo2, HbA1c,
Hemoglobin

Facial Scanning
Scans the face for subtle light changes
caused by blood flow

AI Analysis
Runs AI models to estimate vital signs

The system is entirely non-invasive — no wearables or physical sensors required.

APP INTERFACE

Population Health

Key Benefits

Instant Vital Detection

- 60 seconds for full scan
- Visual feedback & quality score

Remote Monitoring

- Used for telehealth, chronic disease follow-up, and home care
- Ideal for patients in rural areas or with limited mobility

Personal Health Management

- Users can track their vitals over time
- Users can receive nudges, alerts (hydration reminders, red flags, etc)

Scalable, Accessible, Private

Global Scalability

The platform is designed for millions of users worldwide. It provides support for multiple languages.

Broad Accessibility

Available on any smartphone or tablet, even with limited connectivity. Usable in remote, rural areas.

Privacy & Security

End-to-end encryption ensures data security and privacy. Patient data is stored securely and anonymously.

BluHealth Scanner – Key Highlights

Real-Time Insights

On-device AI for instant analysis of vitals such as **Blood Pressure, Heart Rate, Respiration Rate, Spo2, HbA1c** using sensors such as ECG, EMG, PPG, GSR.

Non-Invasive & Portable

Handheld design for convenient field use.

Built for the Field

Rugged and solar-compatible for low-resource environments.

Multi-Sensor Integration

- **ECG** (heart rhythm & arrhythmias)
- **EMG** (muscle activity & neuromuscular health) ex: muscular dystrophy or polymyositis.
- **PPG** (Photoplethysmography for SpO2, Blood Volume, Pulse Rate)
- **GSR** (stress/fatigue analysis via skin conductance)
- **TEMP** (accurate body temperature with site-based calibration)

Engineering Thought Behind the BluHealth Screener & Scanner

Hardware (BluHealth Scanner):

Ruggedized, modular device designed to operate in **low-resource, high-variability environments**

- Solar-compatible, low power, 1 meter drop-tested, with multi-sensor integration
- Sensors: **ECG, EMG, PPG, GSR, TEMP**

Built with AI at the Core

AI-Powered Triage & Insights

Real-time pattern recognition and vitals assessment

ML Models

Detect signal anomalies, classify health risks

LLM-Driven Guidance

Context-aware conversational assistance in local languages

Software (BluHealth Screener App):

Lightweight, AI-powered app built for **speed, simplicity, and offline functionality**

- Operates with minimal bandwidth
- Intuitive for community health workers

BluHealth Platform Architecture: End-to-End Digital Health Stack

BluHealth Platform Comprehensive Patient Journey

■ Primary Process ■ Secondary Process ■ Tertiary Process ■ Optional Diagnostic Path → Process Flow

Current Status

- 1

Prototypes Developed
For ECG, SpO2, Temperature, EMG, and Pulse Rate monitoring
- 3

Pilot Screening Campaign
Targeting 15 million people in AP & Telangana (Binah.AI collaboration)

- 2

Clinical-Grade Sensors Integrated
AD8232, MAX30102, MyoWare AT-04-001
- 4

1:1000 Validation Ratio
For clinical correlation

Our Ambitious Goals

- Democratize Diagnostics**
Anywhere, anytime access to clinical-grade screening

Empower Health Workers
Equip community teams with advanced digital tools
- Enable Population Screening**
Bring screening to real-world environments at scale

Build AI-Powered Platform
Leverage data to drive public health insights and policy

What's Next: Scaling BluHealth for Public Health & National
